Challenges and Solutions for Energy Cybersecurity: Lessons Learnt from ELECTRON & European Projects
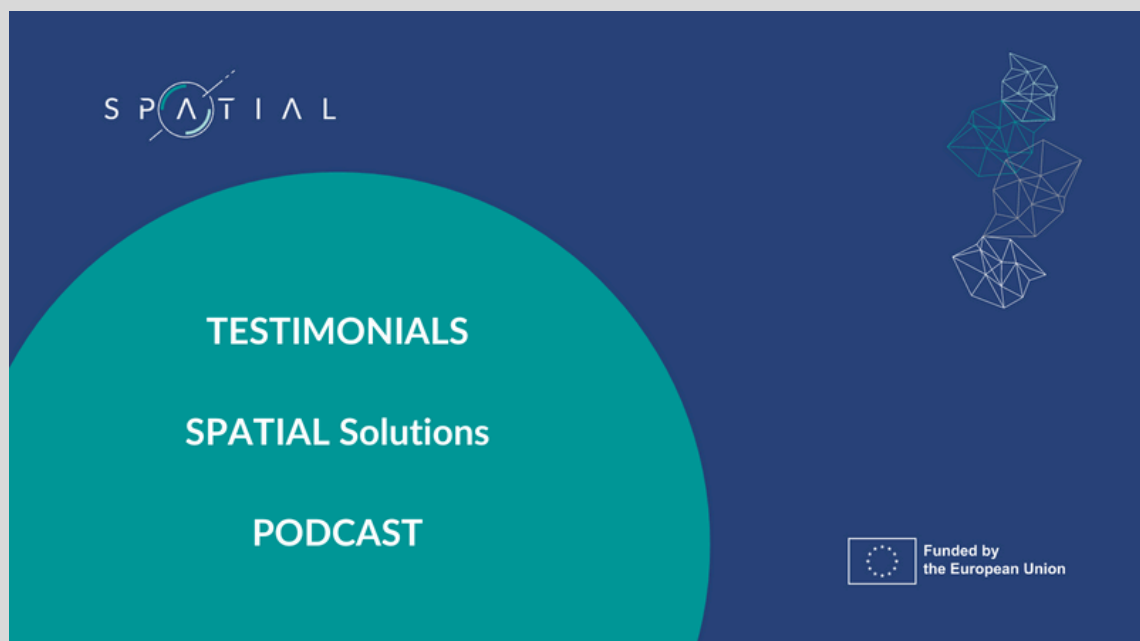

The main challenges in energy cybersecurity are multifaceted and arise from the complex, interconnected, and increasingly digital nature of modern energy systems. Addressing these challenges requires a holistic approach that includes modernizing infrastructure, enhancing cross-sector collaboration, adopting advanced security technologies, and fostering a culture of cybersecurity awareness and resilience.

The scope of the event is to present the latest developments in the domain of cybersecurity for energy networks coming from ELECTRON and other EU R&D funded projects. ELECTRON is an ambitious H2020 funded project aiming at delivering a new-generation platform for electrical and power systems and infrastructure capable of empowering the resilience of energy systems against cyber, privacy, and data attacks.

The event will consist of presentations coming from a variety of stakeholders such as policy makers, cybersecurity experts and researchers, project representatives and industrial representatives.

The event will take place in Thessaloniki, Greece (and online) on Wednesday 05/06 (13:00 CEST).

You can use the following links for **registration**, to find out more **details** and see the agenda.

This month, the SPATIAL project has released several testimonials, conducted a campaign showcasing its solutions, and published the fourth episode of its podcast, featuring interviews with the use case leaders. Check this out!
1. **Testimonials**
2. Solutions:
• **XAI framework for resilient 5G IoT traffic analytics**
• **Module for resilient AI assessment**
• **Introducing the COMPASS framework**
3. **Podcast Episode**
